Introduction and Concepts of Computer Vision

LATEST SUBMISSION GRADE

50%

1. In a *Multi-Class* classification scenario, your model can identify all the different items and people that are present in a given input image.

0 / 1 point

- ☒ True
☐ False

Incorrect

Incorrect! The above statement is true for a *Multi-Label* classification

2. Which of the following statements correctly describes the difference between *object detection* and *object localization*?

0 / 1 point

- ☐ *Object localization* is where you get a bounding box around the *main* subject of the image, while in *object detection* you get a bounding box around *all* of the objects within an image.
- ☒ *Object detection* refers to detecting the object within an image, while *object localization* gives us the bounding box around that object.
- ☐ *Object detection* is where you get a bounding box around the *main* subject of the image, while in *object localization* you get a bounding box around *all* of the objects within an image.
- ☐ They both are the same.

Incorrect

Incorrect! Each of these techniques detect and draw.

3. What is the method that locates an object(s) by *labelling the pixels*, where *each similar object(s) is assigned to the same class*? Type your response here (two words, all lower case).

0 / 1 point

bounding box

Incorrect

Check your spelling.

4. In the context of *Transfer Learning*, the initial training task where the model learns reusable patterns is called a *downstream task*.

1 / 1 point

- ☐ True
☒ False

Correct

Correct! The above statement is true for a *pre-training task*. The task for which the model is borrowed is called *downstream task*.

5. Check all the scenarios in which Transfer Learning could be beneficial.

1 / 1 point

- ☒ When the task you want to perform is a sub-task of an already trained, larger, model.

Correct

Correct!

- ☒ When you don't have enough data for the task you want to perform, which resembles another same or similar, already trained task.

✓ Correct
Correct!

- ☒ To reduce computation and processing cost

✓ Correct
Correct!

- ☐ To ensure better performance

6. What is the name of the built-in TensorFlow layer-type which you can use to increase the dimensions of a 2D image ?

1 / 1 point

- ☐ SampleUp2D
☐ SampleIncrease
☐ UpSampling
☒ UpSampling2D

✓ Correct
Correct!

7. You have an image of dimensions 48 x 48, and you want to upscale it to 240 x 240 using the built-in TensorFlow layer-type which is used to perform such a task (mentioned in Question 6). What will you pass in as *size*=__?

0 / 1 point

5

! Incorrect
Hint: *size* is the ratio of the desired and the original dimensions.

8. Consider the following code:

1 / 1 point

```
my_layer = tf.keras.applications.resnet.ResNet50(  
    input_shape=(224, 224, 3),  
    include_top=False,  
    weights='imagenet')(inputs)
```

What does "include_top=False" mean ?

- ☐ It randomly sets up the weights, instead of using that of ImageNet, for the top most dense layers of ResNet50 when initializing *my_layer* using it.
☐ It discards the first layer of ResNet50 when initializing *my_layer* using it.
☐ It sets the top most layers as untrainable of ResNet50 when initializing *my_layer* using it.
☒ It discards the top most layers of ResNet50 when initializing *my_layer* using ResNet50.

✓ Correct
Correct!

9. What is the name of the technique used in the output dense layer that is used to predict Bounding Boxes ? (Hint: It is a one word answer)

0 / 1 point

iou

! Incorrect
Check your spellings.

Hint: The answer is the second word of a very basic machine learning technique called *Linear* _____.

10. Check all the statements that are true regarding Intersection Over Union (IoU), with regards to Bounding Boxes.

1 / 1 point

- ☐ The values of IoU range from 0 to *all possible positive* values.
- ☐ The closer the value of IoU is to 0 the better is the prediction of the bounding box.
- ☒ IoU is the area of intersection of the two boxes (true and predicted) divided by the total union area of the two boxes.

✓ **Correct**
Correct!

- ☒ The closer the value of IoU is to 0 the poorer is the prediction of the bounding box.

✓ **Correct**
Correct! The lesser the area of intersection the closer to 0 will be the value of IoU
