### A simple Pandas example

```
# Load Pandas
import pandas as pd
# Import W20529's rides in Q4 2017
rides = pd.read_csv('capital-onebike.csv')
```

### A simple Pandas example

```
# See our data
print(rides.head(3))
```

```
Start date
                                End date
                                                         Start station \
                                                  Glebe Rd & 11th St N

                                                       Member
```

### A simple Pandas example

```
rides['Start date']
      2017-10-01 15:23:25
      2017-10-01 15:42:57
Name: Start date, Length: 290, dtype: object
rides.iloc[2]
Start date
                                          2017-10-02 06:37:10
End date
                                          2017-10-02 06:42:53
Name: 1, dtype: object
```

### Loading datetimes with parse\_dates

### Loading datetimes with parse\_dates

```
# Select Start date for row 2
rides['Start date'].iloc[2]
```

```
Timestamp('2017-10-02 06:37:10')
```

#### Timezone-aware arithmetic

```
# Create a duration column
rides['Duration'] = rides['End date'] - rides['Start date']
# Print the first 5 rows
print(rides['Duration'].head(5))
```

```
0 00:03:01
1 02:07:02
2 00:05:43
3 00:21:18
4 00:21:17
Name: Duration, dtype: timedelta64[ns]
```

### Loading datetimes with parse\_dates

```
rides['Duration']\

```

```
0 Sunday
1 Sunday
2 Monday
Name: Start date, dtype: object
```

### Other parts of Pandas

```
# Shift the indexes forward one, padding with NaT rides['End date'].shift(1).head(3)
```

```
0 NaT
1 2017-10-01 15:26:26-04:00
2 2017-10-01 17:49:59-04:00
Name: End date, dtype: datetime64[ns, America/New_York]
```

# Additional datetime methods in Pandas

**WORKING WITH DATES AND TIMES IN PYTHON** 

### Wrap-up

#### **WORKING WITH DATES AND TIMES IN PYTHON**

Max Shron

Data Scientist and Author

### Recap: Dates and Calendars

- The date() class takes a year, month, and day as arguments
- A date object has accessors like .year , and also methods like .weekday()
- date objects can be compared like numbers, using min(), max(), and sort()
- You can subtract one date from another to get a timedelta
- Toturn date objects into strings, use the .isoformat() or .strftime() methods

### Recap: Combining Dates and Times

- The datetime() class takes all the arguments of date(), plus an hour, minute, second, and microsecond
- All of the additional arguments are optional; otherwise, they're set to zero by default
- You can replace any value in a datetime with the .replace() method
- Convert a timedelta into an integer with its .total\_seconds() method
- Turn strings into dates with .strptime() and dates into strings with .strftime()

### Recap: Timezones and Daylight Saving

- A datetime is "timezone aware" when it has its tzinfo set. Otherwise it is "timezone naive"
- Setting a timezone tells a datetime how to align itself to UTC, the universal time standard
- Use the .replace() method to change the timezone of a datetime , leaving the date and time the same
- Use the \_\_astimezone() method to shift the date and time to match the new timezone
- dateutil.tz provides a comprehensive, updated timezone database

### Recap: Easy and Powerful Timestamps in Pandas

- When reading a csv, set the parse\_dates argument to be the list of columns which should be parsed as datetimes
- If setting parse\_dates doesn't work, use the pd.to\_datetime() function
- Grouping rows with .groupby() lets you calculate aggregates per group. For example,
   .first() , .min() or .mean()
- .resample() groups rows on the basis of a datetime column, by year, month, day, and so on
- Use .tz\_localize() to set a timezone, keeping the date and time the same
- Use .tz\_convert() to change the date and time to match a new timezone

### Congratulations!
